# Grade 7 Mathematics — Teacher Manual

OPTIMA ACADEMY ONLINE · FACILITATOR GUIDE · FLORIDA 1205040

🔒 **Facilitator copy.** This manual contains answer-approach guidance, rubrics, grading thresholds, and standards codes. **Do not publish it to students** or add it to the student-facing Canvas course. Keep it in your teacher files or an unpublished teacher module.

## How to use this manual

This is the facilitator guide for the course *as it is actually built*. Every module count, lesson title, assessment, standard, and pacing figure below was read from the finished course and from the course's own scope-and-sequence document — not assumed. Where the course genuinely does not include something the standard Optima manual template expects (for example, discussion forums or survey-quiz module wrappers), this manual says so plainly rather than describing a feature that is not there. Anything that could not be confirmed from the build is marked **[VERIFY]**.

Two sections were added at the school's request and are marked with a green ADDED badge: a **weekly plan for running this course live, two days per week** (Section 14), and a **full standards-coverage overview** (Section 11).

## 1. How this course works

Grade 7 Mathematics is a full-year Florida course (1205040, M/J Grade 7 Mathematics) of **nine modules across four quarters**: Q1 = Modules 1–3, Q2 = Modules 4–5, Q3 = Modules 6–7, Q4 = Modules 8–9. It carries **79 content lessons**, each mirrored by a VR Lesson Resources page. It is delivered On-Demand (asynchronous) to roughly 500 students per facilitator and also runs as a live section on the VR campus.

### A typical lesson

Every content lesson runs the same spine, so students always know what to expect:

1. **Prior Knowledge Check** (a Canvas assignment, 5 pts) — a short activation of the skills the lesson assumes. It opens the lesson.
2. **The lesson page** (GitHub-deployed, navy/gold Optima chrome) — a `VOCABULARY` card, an `EXPLORING THE MATH` card with worked examples, an embedded instructional video, and Wiris-rendered equations, closing with an `ESSENTIAL QUESTIONS`

card.

3. **VR Lesson Resources** — a companion page giving the VR *Location*, the *IFX* objects to spawn, the *Materials*, and the *Activity* (build the mathematics in VR and record a short explanation).
4. **Independent Practice** (a Canvas assignment) — the problem set for the lesson.

The graded touchpoints are the Prior Knowledge Check and the Independent Practice; the lesson and VR pages are the instruction. Note: the practice, mid-module, and summative pages you see in the course folder are near-empty shells — the actual questions live as **Canvas Quiz items**, which is what lets them auto-score and flow into SpeedGrader.

### A typical week (On-Demand)

| Segment | What the student does | Graded? | Tier |
|---|---|---|---|
| Start of a lesson group | Prior Knowledge Check (5 pts) | Auto | 1 |
| 2–3 lessons | Read/watch the lesson, work the examples | No | 4 |
| Per lesson | VR activity + short recording | Reviewed | 2 |
| Per lesson | Independent Practice | Auto / completion | 1 |
| Mid-module | Mid-Module Check | Auto | 1 |
| End of module | Summative Review, then Summative Assessment | Auto (+ any free response) | 3 |

Because there are no discussion forums in this course, the peer/community tier is carried by the VR activities and the weekly study hall rather than by graded discussion posts.

### Major assessments at a glance

| Assessment | Per | Count | How it scores | Teacher time |
|---|---|---|---|---|
| Mid-Module Check | Module | 12 total (M5, M6, M8 have 2) | Canvas Quiz, auto | ~0h |
| Module Summative Review | Module | 9 | Canvas Quiz, auto (practice) | ~0h |
| Module Summative Assessment | Module | 9 | Canvas Quiz, auto; **[VERIFY]** any free-response items | 0–2 min/student on free response |
| VR activity recording | Lesson | ~79 | Teacher-reviewed (see §6) | Batch-review; see workload map |

## 2. Ungraded interactives & the wrapper question

**Ungraded in-lesson content.** The lesson pages carry the vocabulary cards, worked examples, embedded video, and essential-question prompts. These are formation-by-practice: they give the student the exposure and the reps, they produce no submission, and they **cost you nothing to grade**. A student skipping them does not show up as a missing grade — it shows up indirectly in weaker Prior Knowledge Check, Mid-Module Check, and Summative performance. Watch those signals rather than chasing lesson-page views.

**About module wrappers — read this.** The standard Optima design uses a *module intro* and *module outro* built as Canvas Quizzes in survey mode (essential-question first/refined answers, a confidence rating, a "what's still unclear" field, a virtue reflection). **This course does not include those survey-quiz wrappers.** Its only per-module wrapper page is a near-empty "Lesson Maps" page. So the cohort-level confidence data those wrappers would generate does not exist here yet.

**What serves the same purpose in this course:**

- The **Prior Knowledge Check** at the start of each lesson group is your diagnostic opener — its Canvas item analysis tells you which prerequisite skills the cohort is shaky on before the lesson.
- The **Mid-Module Check** item analysis is your mid-point early-warning signal — the highest-leverage 15 minutes you can spend per module. Sort by lowest-scoring question and let that drive a targeted announcement or study-hall focus.

**Optional upgrade:** if you want the confidence/"what's unclear"/virtue-reflection data, add a one-question survey Quiz at the start and end of each module (Canvas-native, survey mode). It is the single highest-value addition available to this course. Keep it to 3–4 questions so it stays a 15-minute triage, not a grading task.

## 3. AI & VR in this course (student-facing)

### AI

The lesson pages themselves contain **no AI-awareness callouts**. The course's AI posture is carried by the **syllabus**: students may use AI to support learning (a concept explained a different way, a check of understanding, a similar worked example) but never to do the thinking or the work — solving, showing steps, and explaining must be the student's own, and any AI use is disclosed briefly. When you speak to AI in announcements or study hall, use that framing. Do not add new AI requirements to student work.

### VR

VR is woven through **every** lesson. Each VR Lesson Resources page follows the same four-part shape, described here platform-agnostically by what the student does:

- **Location** — the named campus space for the activity (e.g., a "Desert Sanctum").
- **IFX** — the interactive objects the student spawns (number tiles, symbols, a divide bar, etc.).
- **Materials** — tools like a 3D pen or sticky notes.
- **Activity** — the student builds the mathematics in the space and **records a short spatial explanation** of their reasoning (for example, building and classifying numbers, or constructing a net for a cylinder).

**How you review it:** the recordings are the reviewable artifact. Batch-watch them and assemble a short **gallery walk** of two or three strong examples to show the cohort (in a study-hall session or an announcement). If a student cannot get into VR for a session, the syllabus guarantees an alternative way to take part — accept a written or screen-recorded version of the same reasoning so they do not fall behind. Some VR pages have a "Content: Coming Soon" placeholder; the Location/IFX/Materials/Activity instructions still stand.

## 4. Using Ignite AI to support students (teacher-facing)

**[VERIFY]** Ignite AI's exact feature names and availability vary by Canvas release and by what Optima has enabled. Confirm the current feature set against Optima's Canvas instance before relying on any specific button.

Ignite AI is the *teacher's* Canvas assistant — kept entirely separate from the student-facing AI posture above. With 500 students, use it to make the course feel personal without adding hours:

- **Summarize quiz item analysis** for a Mid-Module or Summative to find the two or three questions the cohort missed most, then draft the reteach announcement.
- **Draft individualized feedback** on a VR recording or a free-response item — then edit and own it. AI drafts; you decide and send.
- **Surface students who need a nudge** (declining check scores, missed practice) and draft a warm check-in.
- **Generate practice variants** for a student who needs another rep on a Tier 1 skill.

The standing rule for every use: **AI drafts, the teacher decides.** Never use it to surveil, rank, or auto-penalize. A one-line "best Ignite AI move for this module" appears in each module row of the workload map (§10) and the standards table notes (§11).

## 5. Grading categories & Canvas gradebook setup

**As built:** the course ships with all graded items in a *single* Canvas assignment group ("Assignments"), i.e., a straight total-points gradebook with no category weighting. That works, but a weighted scheme communicates emphasis to students and matches the syllabus. Recommended configuration (matches the student syllabus):

| Assignment group | Weight | Items it holds | Tier | Grading method |
|---|---|---|---|---|
| Weekly Practice & Module Checks | 60% | Prior Knowledge Checks, Independent Practice, Mid-Module Checks | 1 | Auto / completion |
| Module Summative Assessments | 30% | Summative Reviews (practice) + Summative Assessments | 3 | Auto (+ rubric on any free response) |
| VR Campus Activities & Participation | 10% | VR activity recordings, study-hall participation | 2 | Rubric / completion |

**Step by step in Canvas:**

1. Gradebook → Settings → enable **Weighted Assignment Groups**.
2. Assignments → create the three groups above and set their weights to 60 / 30 / 10.
3. Move each existing item into its group (drag, or edit the item's group).
4. Set the **grading scheme** (Settings → Grading Scheme) to the school default.
5. For VR activity recordings, set the submission type to **Media/Text Entry** and attach the VR rubric from §6; or score on completion if you prefer.
6. Set your **late / missing policies** to mirror the syllabus (On-Demand: no per-item penalty, zero if not done by quarter end, 10% deduction in the last 14 days).

If you keep the single-group total-points gradebook instead, skip steps 1–3; the emphasis simply won't display as percentages. **[VERIFY]** the exact point values per item against the live Canvas course before finalizing weights.

## 6. Rubrics for teacher-graded items

Most of this course auto-scores in Canvas, so teacher grading concentrates on two places: any **free-response Summative items** and the **VR activity recordings**. Use these two consistent rubrics across all nine modules so grading stays fast (~3–5 min/student) and fair. Paste each into the Canvas item as a native **Canvas Rubric** so it scores in SpeedGrader.

### Rubric A — Summative free-response / show-your-reasoning (12 pts)

| Criterion | Full | Partial | None |
|---|---|---|---|
| **Mathematical understanding** (4) | Correct concept and result; method fits the problem. | Right idea, arithmetic or setup slip. | Concept misapplied or absent. |
| **Quality of reasoning** (4) | Steps are logical, complete, and justified. | Steps mostly sound but with a gap. | No visible or coherent reasoning. |
| **Clarity & precision** (2) | Clear work, correct notation and units. | Readable but imprecise notation/units. | Unclear or unlabeled. |
| **Intellectual honesty** (2) | Own work; names what is uncertain or checks the answer. | Own work; no self-check. | Copied, or AI-generated as own. |

### Rubric B — VR activity recording (10 pts)

| Criterion | Full | Partial | None |
|---|---|---|---|
| **Built the model** (4) | Used the listed IFX/materials to build the required object correctly. | Built, with an error or missing piece. | Not attempted in VR. |
| **Explains the reasoning** (4) | Recording clearly explains *why*, not just what. | Describes steps without the why. | No explanation. |
| **Precision & effort** (2) | Accurate vocabulary; a sincere, complete attempt. | Some imprecision or thin effort. | Insincere / nonsense. |

**[VERIFY]** whether the built Summative Assessments actually contain free-response items or are fully auto-scored. If a module's Summative is fully auto-scored, Rubric A is not needed for it — use it only where a human reads a written response.

## 7. Interactive & assessment catalog

Every graded/reviewed *type* in the course, how it scores, and the recommended teacher move. There are **no discussion forums** in this course, so none are listed.

| Type | Tier | Scores | Recommended teacher move |
|---|---|---|---|
| Prior Knowledge Check (5 pts) | 1 | Auto | Read item analysis as a pre-lesson diagnostic; reteach the weakest prerequisite. |
| Independent Practice | 1 | Auto / completion | Let it run; watch completion in the module-progress view. |
| Mid-Module Check | 1 | Auto | Your early-warning signal — sort by lowest question, act within 48h. |
| Summative Review | 1 | Auto (practice) | Point students to it before the Summative; no grading. |
| Summative Assessment | 3 | Auto (+ any free response) | Grade free-response with Rubric A; batch by question. |
| VR activity recording | 2 | Rubric B / completion | Batch-watch; assemble a gallery walk of 2–3 strong examples. |
| In-lesson content (video, examples, EQs) | 4 | Ungraded | None — formation by practice. |

## 8. Coach, not catch

Your job is to move each student forward, not to detect and punish. In practice:

- Feedback names the next step, not just the error. Lead with what is working in the reasoning.
- Allow re-attempts on Tier 1 practice and checks — they are learning tools, not traps.
- Use Mid-Module item analysis and Ignite AI to **find** students who need help early, then reach out — not to build a case against them.
- On suspected copying or AI-as-own-work: open a conversation, ask the student to talk through their thinking, treat it as formation. Avoid accusation-first workflows.
- Gallery-walk the strong VR recordings publicly; correct common misconceptions to the whole cohort rather than singling out weak work.

## 9. Weekly announcement scripts (On-Demand)

Because students are asynchronous, the weekly announcement is your main presence. Clone this template, then use the per-module openers.

> **Template.** "This week in Grade 7 Math: you should be working through *[Module N, lessons X–Y]*. The one thing not to miss: *[the tricky concept or the due Summative]*. Stuck on *[common sticking point]*? Bring it to study hall on *[day/time]* — we'll build it in VR. Keep steady pacing; small daily reps beat a weekend cram. — *[Your name]*"

| Module | Opener & the one thing not to miss |
|---|---|
| M1 Rational Numbers & Exponents | "We're defining what counts as a rational number and applying the laws of exponents. Watch the sign rules on exponents — that's where points get lost." |
| M2 Operations on Rational Numbers | "Adding, subtracting, multiplying, dividing rationals — including negatives. The one to nail: order of operations with a negative in the mix." |
| M3 Expressions, Equations & Inequalities | "We go abstract: writing and solving equations and inequalities. Don't miss: flipping the inequality sign when you multiply/divide by a negative." |
| M4 Percentages & Proportional Reasoning | "Discounts, markups, taxes, tips, and unit conversions. The Summative leans on percent change — practice it in the Review." |
| M5 Proportional Relationships | "Tables, graphs, equations — all the same relationship. The must-get: finding the constant of proportionality from each representation." |
| M6 Representing Statistical Data | "Our biggest module. Center vs. variation, and choosing the right graph. Pace it — there are two Mid-Module Checks." |
| M7 Simple Experiments & Probability | "Sample spaces, theoretical probability, and simulations. Don't miss: theoretical vs. experimental probability — they're not the same thing." |
| M8 Two-Dimensional Figures & Scaling | "Area of polygons and circles, plus scale drawings. The one to master: circumference and area of a circle with π." |
| M9 Cylinders | "Surface area (via a net) and volume of a cylinder — the year's finish. Build the net in VR; it makes the formula obvious." |

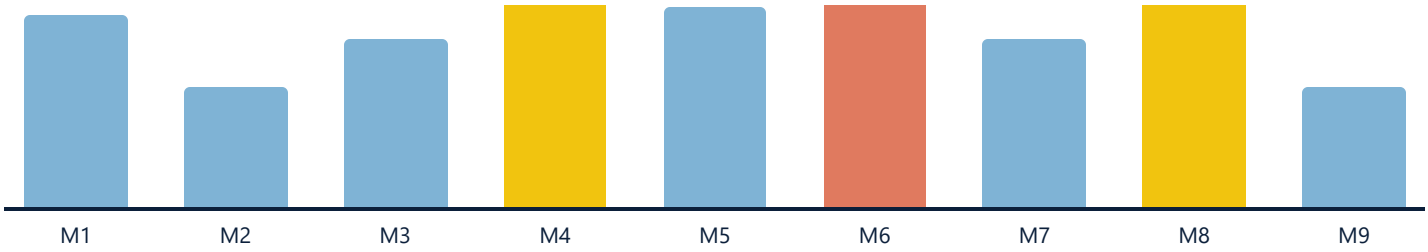

**Situational scripts.** *Pre-Summative:* "The Module *[N]* Summative opens this week. Do the Summative Review first — it mirrors the assessment." *Re-engagement:* "Haven't seen work from you in a bit — no penalty, just check in with me so we keep you on track before the quarter closes."

## 10. Teacher workflow & workload map

**A normal On-Demand week, in order:** (1) read the latest Mid-Module / PKC item analysis to spot confusion; (2) batch-review the week's VR recordings on Rubric B; (3) grade any free-response Summative items on Rubric A; (4) post the weekly announcement; (5) answer messages and host study hall. Auto-graded Tier 1 items cost ~0h; the VR recordings and any free response are the real time.

Relative facilitator load by module (driven by content-lesson count → number of VR recordings, plus extra Mid-Module Checks and the Summative). Plan extra time on the **coral** module.

Blue = lighter, gold = moderate, coral = heaviest. M6 (14 lessons, two Mid-Module Checks) is the year's peak — budget extra review time in Q3.

**Ignite AI move by module:** M1–M3 draft reteach notes from PKC analysis; M4 summarize percent-change misses; M6 (heaviest) summarize both Mid-Module Checks and batch-draft VR feedback; M8 draft variant practice on circle area/circumference; M9 draft feedback on net-and-volume recordings.

## 11. Standards coverage map ADDED

ADDED **Requested addition — an overview of where the standards are covered across the course.** Codes and essential questions below are taken verbatim from the course's own scope-and-sequence document ( `MATG07ScopeandSequence.docx` ); they are Florida B.E.S.T. Mathematics standards. Standards are not printed on student pages — keep them in this teacher copy.

### By module (quick reference)

| Mod | Q | Theme & essential question | B.E.S.T. standards | ~Days |
|---|---|---|---|---|
| **M1** | Q1 | **Rational Numbers & Laws of Exponents.** How can the laws of exponents simplify expressions, and how do we represent rational numbers in different forms? | MA.7.NSO.1.1 (laws of exponents); MA.7.NSO.1.2 (rewriting rational numbers) | 12 |
| **M2** | Q1 | **Operations on Rational Numbers.** How do order of operations and the four operations with rational numbers solve real-world problems and simplify expressions? | MA.7.NSO.2.1 (order of ops w/ exponents & absolute value); MA.7.NSO.2.2 (four operations); MA.7.NSO.2.3 (problem solving) | 10 |
| **M3** | Q1 | **Algebraic Linear Expressions, Equations & Inequalities.** How do we use expressions and equations to solve problems and make decisions? | MA.7.AR.1.1 (add/subtract linear expressions); MA.7.AR.1.2 (equivalent expressions); MA.7.AR.2.1 (one-step inequalities); MA.7.AR.2.2 (two-step equations) | 11 |
| **M4** | Q2 | **Percentages & Proportional Reasoning.** How do we use percentages, proportions, and conversions to solve problems and make decisions? | MA.7.AR.3.1 (percentages); MA.7.AR.3.2 (proportions); MA.7.AR.3.3 (conversions) | 13 |
| **M5** | Q2 | **Proportional Relationships.** How do we use proportional reasoning to represent real-world situations? | MA.7.AR.4.1 (determining a proportional relationship); MA.7.AR.4.2 (constant of proportionality); MA.7.AR.4.3 (graphing); MA.7.AR.4.4 (translating); MA.7.AR.4.5 (solving) | 13 |
| **M6** | Q3 | **Representing Statistical Data.** How do statistical measures and graphs let us compare, predict, and interpret data sets? | MA.7.DP.1.1 (measures of center & variation); MA.7.DP.1.2 (compare two sets); MA.7.DP.1.3 (predictions about a population); MA.7.DP.1.4 (circle graphs); MA.7.DP.1.5 (choosing/creating graphs) | 20 |
| **M7** | Q3 | **Simple Experiments & Probability.** How do sample spaces, theoretical probability, and simulations let us predict the likelihood of events? | MA.7.DP.2.1 (sample spaces); MA.7.DP.2.2 (likelihood); MA.7.DP.2.3 (theoretical probability); MA.7.DP.2.4 (simulations) | 12 |
| **M8** | Q4 | **Two-Dimensional Figures & Scaling.** How do formulas and scale drawings let us measure areas and circumferences of figures and circles? | MA.7.GR.1.1 (area of trapezoids/parallelograms/rhombi); MA.7.GR.1.2 (polygons & composite figures); MA.7.GR.1.3 (circumference & π); MA.7.GR.1.4 (area of a circle); MA.7.GR.1.5 (scale drawings) | 15 |
| **M9** | Q4 | **Cylinders.** How do surface-area and volume formulas — and a net — let us solve real-world cylinder problems? | MA.7.GR.2.1 (surface area via net); MA.7.GR.2.2 (surface-area problems); MA.7.GR.2.3 (volume problems) | 10 |

### By strand (where each B.E.S.T. benchmark is taught & assessed)

| Strand | Benchmarks | Taught in | Assessed in |
|---|---|---|---|
| Number Sense & Operations (NSO) | MA.7.NSO.1.1–1.2, MA.7.NSO.2.1–2.3 | Modules 1–2 | M1 & M2 Mid-Module Checks + Summatives |
| Algebraic Reasoning (AR) | MA.7.AR.1.1–1.2, 2.1–2.2, 3.1–3.3, 4.1–4.5 | Modules 3–5 | M3–M5 Mid-Module Checks + Summatives |
| Data Analysis & Probability (DP) | MA.7.DP.1.1–1.5, MA.7.DP.2.1–2.4 | Modules 6–7 | M6 (two checks) & M7 Summatives |
| Geometric Reasoning (GR) | MA.7.GR.1.1–1.5, MA.7.GR.2.1–2.3 | Modules 8–9 | M8 (two checks) & M9 Summatives |

Every benchmark is taught across that module's lessons and assessed by the module's Mid-Module Check(s) and Summative Assessment. The Summative Review previews the same benchmarks ungraded. No B.E.S.T. benchmark for the course is left uncovered.

## 12. What makes this course classical & cultivating culture

**What makes it classical.** The mathematics is taught for understanding before mechanism, in the Optima tradition:

- **An essential question opens every module** (see §11) and returns inside each lesson's `ESSENTIAL QUESTIONS` card — students meet the "why" before the procedure.
- **Wonder before formula.** Concepts are built up from worked examples and, in VR, from objects the student constructs with their own hands — number sets built and classified, a cylinder's net unfolded — so the formula arrives as the description of something already seen.
- **Reasoning is the graded good.** The rubrics reward *why*, not just the answer, and intellectual honesty (showing and checking your own work) is an explicit criterion — the classical formation lever.
- **Fluency and understanding together.** The Prior Knowledge Check → lesson → practice spine treats facility with the numbers as the ground on which reasoning stands.

**Cultivating culture asynchronously.** With 500 students and no discussion board, culture is built through: the weekly announcement that models curiosity (pose the week's essential question, not just the due date); the VR gallery walk that lets students see each other's reasoning; naming students' good thinking in public comments; and holding the virtue thread visible — perseverance through the hard multi-step problems, honesty in showing work, self-government in pacing. Treat feedback as relationship, not correction.

## 13. Sensitive-content flags

A full review of all 323 formatted pages found **no sensitive content**: no mature themes, violence, or contested material. Real-world problem contexts are ordinary grade-7 fare (money, distances, discounts, recipes). **No advance family script is required for this course.** The only operational flag is technical, not content: the course relies on the **Wiris / WirisQuizzes LTI** for its equation images and quiz items — confirm it is installed in the Canvas account before the course is imported, or Wiris-based items will fail to load.

## 14. Running this course live, two days per week ADDED

ADDED **Requested addition — a weekly plan for adapting the asynchronous lessons to a live class that meets two days per week.** The content, assignments, and assessments do not change; what changes is that you compress the self-paced spine into two live meetings and move the reps to between-class work.

### The core idea

The async course already has a clean spine — *Prior Knowledge Check → lesson → VR activity → Independent Practice*, with a Mid-Module Check partway and a Summative at the end. For a live 2-day/week section, use **Day 1 to launch and teach** a lesson group and **Day 2 to build, check, and reteach**. Aim for roughly **one lesson group (two lessons) of progress per week**; students complete the Independent Practice and finish any VR recording between meetings.

### The repeatable weekly template

| | Live session (VR campus / Teams) | Between classes (async, in Canvas) |
|---|---|---|
| **Day 1**<br>**Launch & teach** | Warm-up with the **Prior Knowledge Check** as a do-now (project the item analysis, fix prerequisite gaps). Pose the module's **essential question**. Teach the new lesson from the lesson page's worked examples; work 1–2 problems together with student input. | Students finish the lesson's **Independent Practice**; start the **VR activity**. |
| **Day 2**<br>**Build & check** | Do the **VR activity together** on campus (build with the IFX, narrate the reasoning) — this replaces the solo recording for live students, or they record in class. Then a quick **guided-practice / mini-check**; reteach the one thing the practice showed was shaky. | Students finish the second lesson's practice; take the **Mid-Module Check** when the group reaches it; do the **Summative Review** before a Summative week. |

Class time replaces the discussion/community tier the async course lacks: use it for the questions, guided practice, and shared VR building that On-Demand students get in study hall.

### How the year paces at two days per week

Approximate live weeks per module (about two lessons per week, plus a review/assessment beat per module). Adjust to your calendar; the heaviest stretch is Module 6.

| Quarter | Modules & approx. live weeks |
|---|---|
| Q1 | M1 (~4 wks) · M2 (~3 wks) · M3 (~4 wks) |
| Q2 | M4 (~5 wks) · M5 (~4 wks) |
| Q3 | M6 (~7 wks — two Mid-Module Checks) · M7 (~4 wks) |
| Q4 | M8 (~5 wks) · M9 (~3 wks) |

### Weekly adaptation tips

- **Front-load the check.** The Prior Knowledge Check is your best do-now — it turns the first five live minutes into targeted review instead of a cold start.
- **Do the VR activity *together*.** The single biggest live-class win is building the mathematics as a group in VR; solo recordings become optional for live students.
- **Keep the assessments identical.** Same Mid-Module Checks and Summatives as On-Demand — only the timing moves to the class schedule. Assignments still open/close by quarter.

- **Protect a reteach beat.** Reserve the back half of Day 2 for the one concept the week's practice showed was weak; don't let new content crowd it out.
- **Slow down for M6.** Statistics is the year's densest module (14 lessons, two checks) — give it the extra weeks rather than rushing center-vs-variation.
- **Two-day absence plan.** A student who misses a session can watch the lesson page and video async and submit the VR activity as a recording — the async course *is* the make-up path.

---

Grade 7 Mathematics · Florida course 1205040 (M/J Grade 7 Mathematics) · Optima Academy Online. Facilitator copy — do not publish to students. Synthesized from the finished course (9 modules, 79 content lessons, 323 formatted pages) and the course scope-and-sequence (verified B.E.S.T. standards). Items marked [VERIFY] should be confirmed against the live Canvas course before finalizing.
